Profile

A data and analytics engineering leader with 6+ years across SaaS, proptech, e-commerce and sport. Builds and scales teams and data platforms from the ground up, and designs AI-powered data products, LLM summarisation, forecasting and pricing intelligence, that change how commercial teams operate and drive measurable, company-attributed revenue. Comfortable across the full stack (GCP/BigQuery, AWS/Redshift, Snowflake, dbt/Dataform), owning the technical vision and translating it into impactful executive decisions.

Work Experience

Pinpoint - Analytics engineering manager

March 2025 – Present

- Set the technical and business direction for the analytics function from zero to four analysts, owning the full people-management cycle (hiring, objective-setting and quarterly performance reviews).
- Led development of the data platform using Google BigQuery, Cloud Functions, Dataform and Looker.
- Reduced BigQuery costs by ~75% (from ~£5k to ~£2k per month) through query and pipeline optimisation, while maintaining internal and external pipelines.
- Upskilled the data engineering team to build streaming pipelines using Ruby on Rails and Python.
- Created the company's first GitHub data repository and external-facing dashboard (recruitment benchmarking tool)  which brought in £250k in new bookings in the first quarter.
- Cut ingestion tooling costs by migrating the pipeline off Stitch (~£5k/year) and rebuilding it natively in GCP using Cloud Functions.
- Designed and built an internal customer-intelligence platform, adopted company-wide, that summarises customer activity in real time as events occur, an event-driven Dataform pipeline triggering Cloud Functions to run LLM summarisation in Vertex AI, architected to scale to thousands of events per day across the company's ~5k companies, served to a Claude-powered natural-language interface across a web app, a HubSpot-embedded app and an MCP server.
- Created product adoption metrics using customer events to enhance operational agility and hit 110% upsell targets.
- Created upsell workflows with Posthog, Zapier and n8n to alert CSMs, Marketing and Sales of upsell signals in real time.
- Owned the strategy for company-wide data-literacy initiatives and optimised data flows and integrations to reduce cost and remove bottlenecks, applying product-management best practices to improve decision-making.
- Received high performance award for AI usage, speed, simplicity and humanity.

Stack: SQL | Google BigQuery | Cloud Functions | Dataform | Looker | Python | Ruby on Rails | Vertex AI | MCP | Posthog | Zapier | n8n | HubSpot | Git

Zoopla - Analytics Engineer

July 2024 – March 2025

- Owned the entire analytics engineering workflow (dbt, Redshift, Tableau) across a ~3,000-model environment serving ~10 analysts at millions-of-rows scale, building and governing the semantic layer that gave consistent metric definitions across the business and acting as the main liaison between analysts and data engineers.
- Implemented automation and optimisation opportunities to continuously improve and develop self-service analytics.
- Communicated with highly technical and non-technical stakeholders (data engineers, commercial teams) to ensure business requirements were clear.
- Trained and upskilled analysts in dbt, data modelling, Tableau and analytics engineering best practices.
- Managed and transformed large-scale datasets in Amazon Redshift using dbt, ensuring clean, well-structured data for downstream analysis and reporting.
- Terraformed Redshift step functions to schedule and automate dbt model execution, ensuring regular updates and data accuracy.
- Reduced warehouse costs by ~10% by restructuring materialised tables feeding Tableau into views (eliminating storage and repeated-scan costs) and introducing snapshots to avoid daily full refreshes; built a Tableau dashboard for daily cost monitoring.
- Built an AI-powered customer intelligence tool that shifted Customer Success advice from gut-feel to data-driven, joining historical Zoopla sales data with publicly available housing data via dbt into an S3 bucket read by Amazon Bedrock, delivered through a web UI (real-time branch talking points) and a Tableau dashboard (listing-level sell propensity and pricing recommendations).
- Contributed to a Zoopla-attributed 35% revenue uplift across upsell and new revenue in the first six months of the tool's deployment.

Stack: DBT | SQL | Amazon Redshift | Tableau | Python | Apache Airflow | Terraform | Git | Amazon Bedrock

Commercetools - Business Intelligence Analyst

October 2022 – July 2024

- Owned company BI and reporting using SQL, GCP/Snowflake and Tableau, including the dashboards behind board reviews, and delivered insights to product managers and C-suite for executive decision-making.
- Introduced the first Dataform layer and analytics-engineering practice at the company, setting up a data repository and a governed semantic layer of standardised production data models automated through Airflow.
- Automated Salesforce and HubSpot ingestion into BigQuery, replacing manual RevOps data pulls and enabling self-serve across the company.
- Built a customer usage forecasting model in Dataform (SQL and JavaScript) with automated alerting, flagging when a customer's usage matched historic patterns so CS could proactively prepare them ahead of peak sale periods; contributed to a ~70% customer renewal rate.
- Cut report turnaround from days to hours by automating pipelines from source systems into BigQuery, enabling faster, more reliable reporting against business SLAs.
- Supported data engineers in planning and developing new data models enabling user-friendly, customised reporting.
- Enabled international business units with BI solutions tailored to their regional needs.
- Drove strategies to grow data culture and data-driven decision-making across the company.

Stack: SQL | Google BigQuery | Snowflake | Tableau | Python | Apache Airflow | Dataform | Circle CI | Git | HubSpot | Salesforce

Chelsea Football Club - Data Tech Lead (Business Analytics)

September 2022 – June 2023

- Owned the technical vision for Chelsea's post-acquisition data platform migration, leading a team of three analysts to consolidate data held across multiple third-party companies into a single greenfield GCP warehouse, a platform choice I made through market and qualitative analysis.
- Managed the migration end to end, liaising with external data holders and ensuring GDPR compliance and PII handling across the transfer.
- Built the analytics-engineering platform on dbt feeding into BigQuery, automated reporting pipelines with Circle CI, and upskilled analysts onto engineering principles including version control and no direct-to-production changes.
- Built Chelsea's first reporting layer, an internal dashboard plus a customer-facing version surfaced in the Chelsea app so fans could see the metrics most relevant to them.
- Ran A/B experiments on new features during the Chelsea app revamp to validate fan and customer experience.
- Identified and implemented efficiency, scalability and performance improvements across the data stack.
- Provided ad hoc data modelling, forecasting and analysis for cross-business functions, and drove marketing and operations toward data-driven decision-making.
- Conducted regular QA audits to ensure data quality.

Stack: SQL | Google BigQuery | Snowflake | DBT | Tableau | Looker | Python

Carbon - Business Intelligence Analyst

September 2020 – September 2021

- Developed and maintained data analytics platforms and data models.
- Prepared reports on probability of default using data extracted with Google BigQuery SQL.
- Built a salary-discrepancy analysis (stated vs actual income) that was adopted into the customer credit-checking process to inform loan-limit decisions.
- Provided and staged implementation of BI solutions across departments using Tableau and Google Data Studio.
- Analysed loan portfolios to identify defaults and correlations.
- Enhanced concentration risk views and tested loss assumptions.
- Recommended process and policy improvements to close reporting gaps and address identified risks, using A/B testing techniques.

Stack: Google BigQuery | Google Data Studio | Tableau | Python

Expertise

Data warehousing/storage

- Google BigQuery
- Amazon Redshift
- Snowflake

Orchestration

- Apache Airflow
- Terraform
- Circle CI
- Cloud Functions
- Git

Languages

- SQL
- Python
- Javascript
- Ruby on Rails

Data transformation

- DBT
- Dataform

Workflow automation

- Posthog
- Zapier
- Replit
- n8n
- Loveable

Data visualisation

- Tableau
- Looker
- Power BI

AI engineering

- MCP building
- Claude code
- Vertex AI (Gemini)
- Amazon Bedrock

Education

Masters in Data Science

University of Salford 

September 2021 – September 2022

Masters in Neuroscience

University of Ibadan 

2018 – 2020

B.Sc. Human Physiology

Delta state university 

2012 – 2016
